How to Build a Time Machine By Paul Davies

With his rare knack for making cutting-edge theoretical science effortlessly accessible, world-renowned physicist Paul Davies has won a devoted readership with his bestselling books *The Fifth Miracle*, *About Time*, and *God and the New Physics*. Now Davies tackles an issue that has intrigued humankind for centuries— is time travel possible?

The answer, insists Davies, is definitely yes—once you iron out a few kinks in the space-time continuum. With tongue planted seriously in cheek, Davies explains that to visit the future, all you need is a little help from gravity and a spaceship that can travel just under the speed of light. As for returning to the past, the best bet is to find a convenient black hole equipped with a traversable worm hole—though if you're not careful you may find yourself sucked into a one-way journey to nowhere. Finally, having brilliantly laid the theoretical foundation, Davies sets out a four-stage process for assembling the time machine and getting it to work. He also addresses the ticklish question of why, if time travel is really feasible, we're not swarmed with time tourists visiting us from the future.

Wildly inventive and theoretically sound, *How to Build a Time Machine* is creative science at its best—illuminating, entertaining, thought provoking, and fascinating in every way.

Editorial Review

From Publishers Weekly

Is time travel possible? If so, what manner of machine would one need to traverse this fourth dimension? Covering ground similar to J. Richard Gott's *Time Travel in Einstein's Universe*, this slim, tongue-in-cheek treatise invokes the primary tenet of Einstein's special theory of relativity that both time and space are elastic to illustrate that time travel, while impractical, is definitely possible. The time travel mechanisms Davies (*The Fifth Miracle*) envisions are dramatically different from the devices that SF authors H.G. Wells and Ray Bradbury have employed in their fiction. All that's needed to travel to the future, noted theoretical physicist Davies asserts, is a little help from gravity and a spaceship that can reach speeds just under the speed of light. Traveling to the past is a trickier task, however, and Davies spends the bulk of his book explaining the components needed to construct a wormhole (a black hole "with an exit as well as an entrance"). Despite the author's penchant for diagrams and his habit of highlighting and repeating his major points, readers will struggle to accept some of his more difficult and extreme propositions such as the existence of an exotic matter possessing antigravitational properties, which is vital to his construction of a wormhole. While Davies's discussion of the paradoxes inherent in time travel and of the physical laws that seem to prevent it is both thought provoking and accessible, his limited focus on wormholes may disappoint those hungering for a broader discussion of time travel technology.

From Scientific American

Is time travel possible? Yes, says Davies, who recently retired (in his early 50s) as professor of mathematical physics at the University of Adelaide in Australia to concentrate on his writing. But "a moment's thought uncovers some tricky questions." Whereupon he discusses lucidly and engagingly both the concepts of physics that establish the possibility of time travel and the tricky questions. You could reach the future "by simply moving very fast." For visiting the past, the most popular proposal is a wormhole, "a sculpture in the structure of space that provides a shortcut between two widely separated spaces." There may be "cosmic taboos," though, that make time travel forever elusive.

A time-traveling machine *can* be constructed--provided one rotates a superdense cylinder of infinite length or locates a wormhole. Such are the contraptions contemporary physicists such as Frank Tipler and Kip Thorne (*Black Holes and Time Warps*, 1994) have conceived in their explorations of whether it's possible to build a time machine. Davies, also a physicist, has an impressive track record of writing popular titles about space-time (e.g., *About Time*, 1995), and he opens up the fascinating yet weird concept of time travel to readers new to the basic features of space-time. That does not mean his precis is simple, but it is lucid throughout, even sketching out the four technical parts required in a time machine that exploits quantum effects. And if a machine were actually built, many paradoxes would arise, which Davies explores in an inventive manner. An excellent explainer, Davies will well reward the curious bent on bending space-time.

From reader reviews:

Russell Bussey:

The e-book with title How to Build a Time Machine contains a lot of information that you can learn it. You can get a lot of advantage after read this book. This kind of book exist new knowledge the information that exist in this e-book represented the condition of the world now. That is important to yo7u to know how the improvement of the world. This particular book will bring you inside new era of the internationalization. You can read the e-book with your smart phone, so you can read it anywhere you want.

Linda King:

People live in this new day time of lifestyle always try to and must have the spare time or they will get large amount of stress from both way of life and work. So , once we ask do people have free time, we will say absolutely indeed. People is human not really a robot. Then we request again, what kind of activity do you possess when the spare time coming to a person of course your answer will unlimited right. Then do you ever try this one, reading books. It can be your alternative inside spending your spare time, typically the book you have read is How to Build a Time Machine.

Donna Nichols:

You are able to spend your free time to read this book this guide. This How to Build a Time Machine is simple to create you can read it in the playground, in the beach, train and also soon. If you did not get much space to bring typically the printed book, you can buy typically the e-book. It is make you simpler to read it. You can save the book in your smart phone. Consequently there are a lot of benefits that you will get when you buy this book.

Adam Gutierrez:

What is your hobby? Have you heard which question when you got pupils? We believe that that problem was given by teacher to their students. Many kinds of hobby, All people has different hobby. And you know that little person including reading or as studying become their hobby. You need to understand that reading is very important and book as to be the matter. Book is important thing to incorporate you knowledge, except your own personal teacher or lecturer. You get good news or update in relation to something by book. Different categories of books that can you choose to use be your object. One of them is actually How to Build a Time Machine.
